

Kineticopro's unique approach to water filters

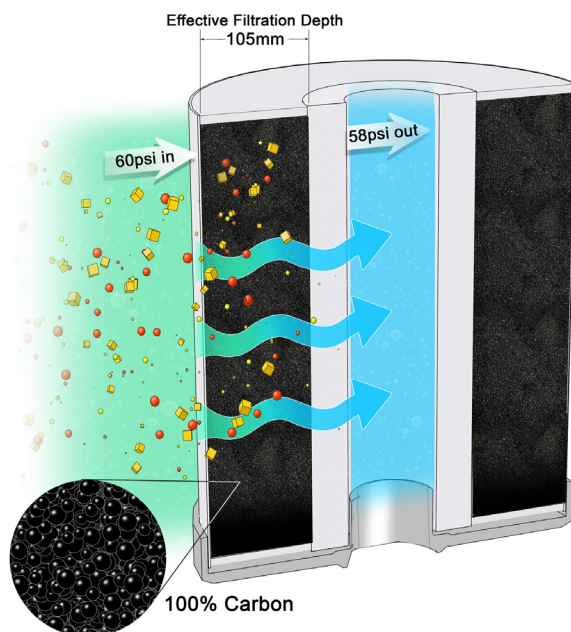

The KPRO Filter difference:

- Turbo flow
- Hollow carbon
- Modular configurations
- High capacity
- High flow rate

The difference between Hollow Carbon and Carbon blocks

Kineticopro's proprietary high-capacity hollow carbon filtration system has higher porosity with a greater surface area that allows for longer contact time, leading to the removal of multiple impurities simultaneously at higher flow rates with minimal pressure drop. Our binder-free approach removes the particulate matter that affects taste, odor and health, and causes scale that degrades all water-use systems, reducing their reliability and service life, while raising maintenance and replacement costs.

KINETICOPRO'S HOLLOW CARBON FILTERS
(Low Pressure Drop)

STANDARD CARBON BLOCK
(High Pressure Drop)
